

Exploring the Tourism Opportunities of Southeast Europe

A Multivariate Choropleth of Infrastructure and Attractions

This map illustrates the tourism potential of South-Eastern Europe using a multivariate choropleth approach that integrates two indicators: tourist-infrastructure density and the concentration of attractions aggregated to a regular grid. High-value cells—where both indicators score strongly—identify key tourism hubs such as major coastal zones and capital cities. Lower-value areas represent regions with limited tourism development but notable potential for future growth. A topographic basemap and major city labels provide context and support the interpretation of accessibility patterns and attraction intensity across the region.
